Technical information	5
Main features	5
Key fixes	6

Introduction

About this document

This document describes the changes made in

- ABBYY Timeline 6.2.2
- The update applied to all regions: EU, US, JP, AU

About the product

ABBYY Timeline is a process intelligence platform comprising over twenty-five process analysis tools. More than a mere process tracker, ABBYY Timeline will monitor all events within your company in real time and build a detailed map of each process, all while maintaining the flow of your business. ABBYY Timeline accepts event data from any number of systems of record and automatically reconstructs the underlying business process logic behind the data. A variety of pre-built analyses are ready to quantify your process performance, identify your process execution issues and perform root cause analysis. The ABBYY Timeline platform also supports operational monitoring through its continuous assessment of new event data to determine if any adverse conditions occur and can immediately notify you or other business operations personnel so you can act. Using advanced algorithms, ABBYY Timeline extracts and reads the time stamps used to record specific events along your processes. The software then visually models these time stamps in such a way that you can instantly identify deviations from an ideal process flow – to find the root cause of a problem that may be costing your business money. ABBYY Timeline is aimed for use by anyone involved in business process improvements of any type of scale or nature.

Improvements

Updated the license generation process to ensure backward compatibility across supported product versions while strengthening security.

- Versions earlier than 6.2.1 continue to use the legacy hashing algorithm for license generation.
- Version 6.2.1 and later use the new, more secure hashing algorithm.

This enhancement addresses a security issue identified by Sonar, which flagged the legacy hashing algorithm. Because on-premises deployments running versions prior to 6.2.1 do not support the new decryption mechanism, the license generation service now automatically selects the appropriate hashing algorithm based on the target product version. This ensures seamless compatibility with existing deployments while improving security for newer releases.
